

Principal Component Analysis (PCA) [Dimensionality Reductor]

② Model performance Degrade

Two different ways to remove curse of Dimensionality

① Feature Selection

② Dimensionality Reduction (PCA)

Imp features

Feature Extraction

Feature Selection Vs Feature Extraction

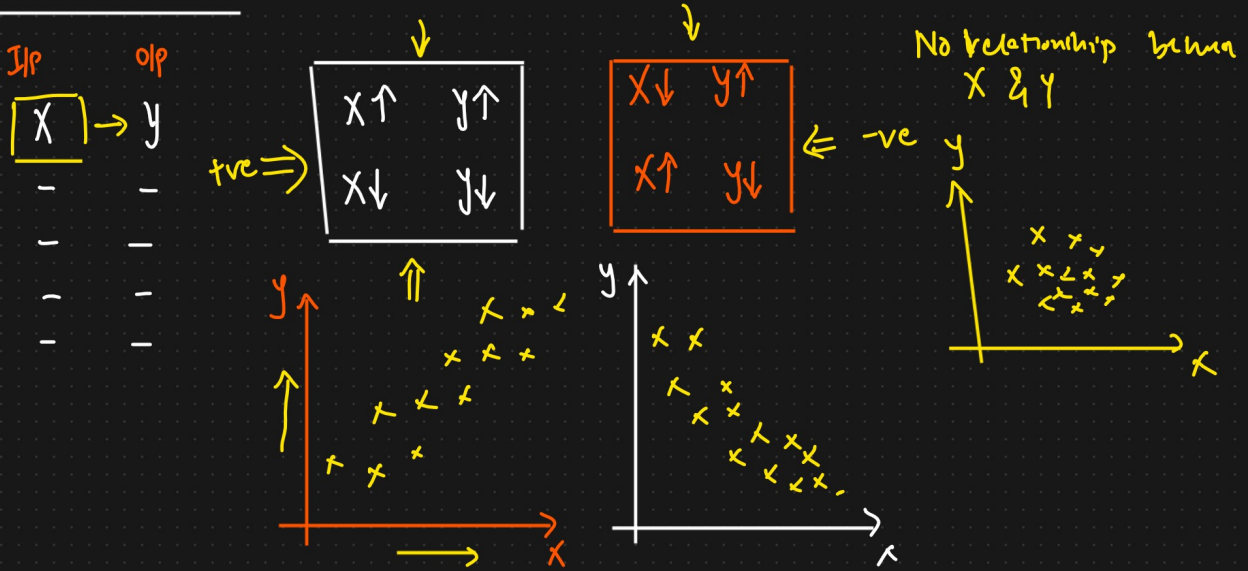

↳ Dimensionality Reduction

① Why Dimensionality Reduction?

- * Prevent → Curse of Dimensionality
- * Improve the performance of the model
- * Visualize the data → understand the data

Feature Selection

$$\text{Cov}(x, y) = \frac{\sum_{i=1}^n (x_i - \bar{x}) * (y_i - \bar{y})}{N-1} = \begin{matrix} +ve \\ -ve \\ \approx 0 \end{matrix}$$

≈ 0 {No Relationship}

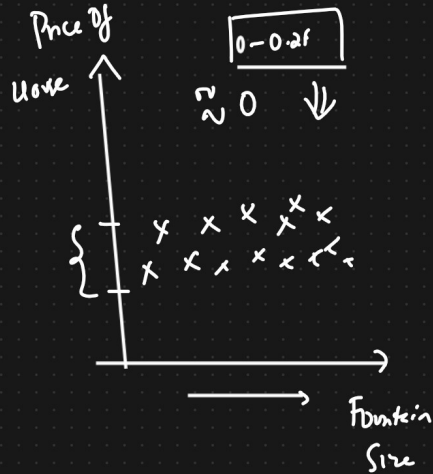

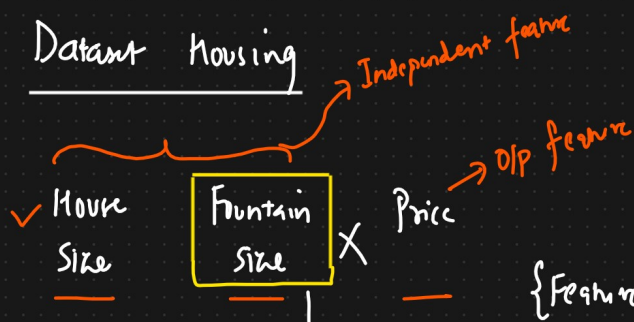

-ve correlated

$$\text{Pearson Correlation} = \frac{\text{Cov}(x, y)}{\sigma_x * \sigma_y} = \underline{-1 \text{ to } 1}$$

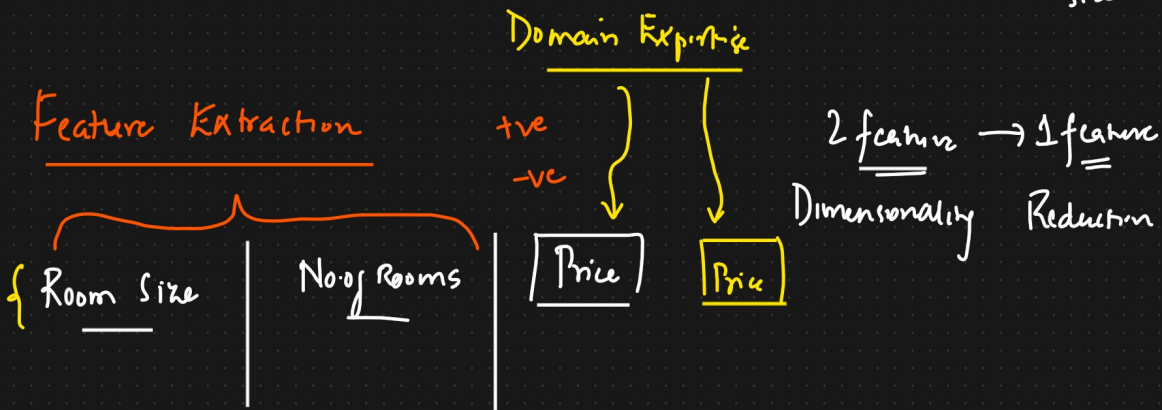

The more toward the value of +1 the

more +ve correlated X & Y is

Dataset Housing

Feature Extraction

Transformation To extract New feature

PCA Geometric Intuition

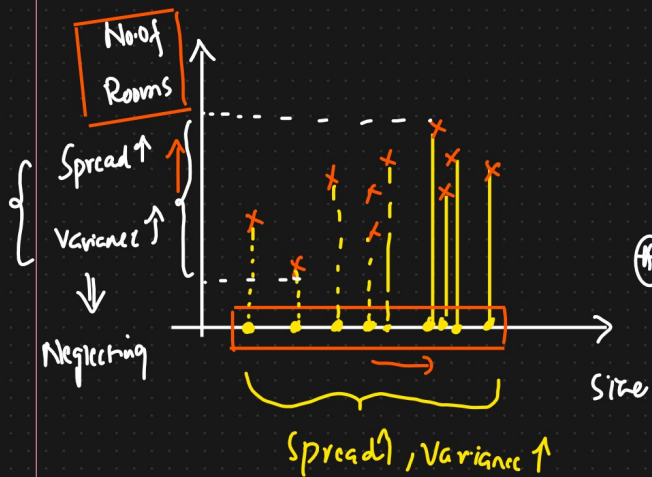

{ Dimensionality Reduction }

Housing Dataset

Size of House | No. of Room | Price \nearrow DIP

PCA

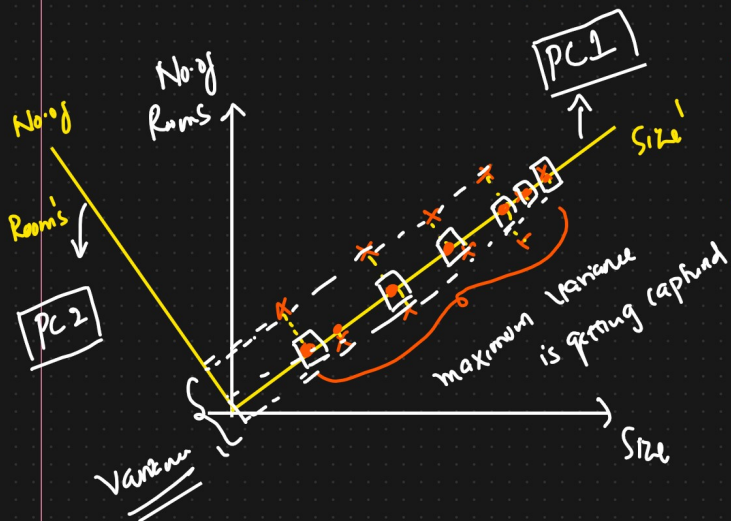

2 dimension \rightarrow 1 dimension

2D \rightarrow 1D

⊕ Loss of information (No. of Rooms)

Feature Extraction

Eigen decomposition on Matrix

Transformation

2 Dimension

PC1, PC2

$\text{Var}(PC1) > \text{Var}(PC2)$

3 Dimension

PC1, PC2, PC3

$\text{Var}(PC1) > \text{Var}(PC2) > \text{Var}(PC3)$

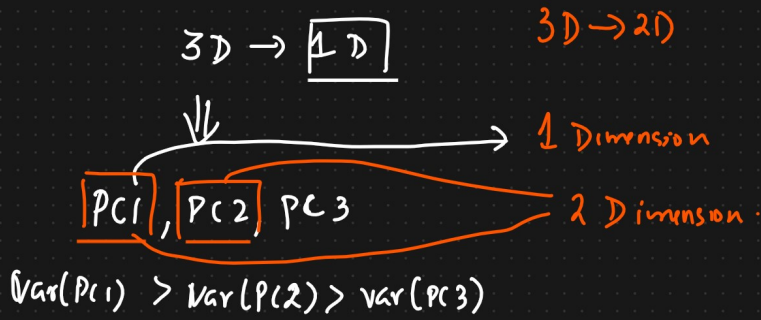

2D \rightarrow 1 Dimension

Much Information is not lost

2 Best Principal Component

To get the best Principal Component which captures maximum variance

Maths Intuition behind PCA Algorithm

2D → 1D

- ① Projection ✓
- ② Cost function → Variance ✓

$$\text{Proj}_{P_i} u = \frac{P_i \cdot u}{\|u\|}$$

$\|u\|=1 \rightarrow$ unit vector

$$\text{Proj}_{P_i} u = P_i \cdot u \Rightarrow \text{Scalar value}$$

$$P_0', P_1', P_2', P_3', P_4', \dots, P_n'$$

↓
Scalar values

↓
Variance

$$P_0', P_1', P_2', P_3', P_4', \dots, P_n'$$

$$\downarrow$$

$$x_0', x_1', x_2', x_3', x_4' \dots x_n'$$

Max Variance = $\sum_{i=1}^n \frac{(x_i - \bar{x})^2}{n}$ { Goal: Find the best unit vector which captures maximum variance }

↑

Eigen vectors And Eigen values.

① Covariance Matrix between features

② Eigen vectors and Eigen values will found out from this covariance matrix

{ Linear Transformation of matrix }

$$A v = \lambda v$$

③ Eigen vector → Eigen value → magnitude of the eigen vector → capture the maximum variance

Eigen vectors And Eigen values [Linear Transformation]

[Eigen decomposition of covariance Matrix]

↓

Eigen vector & Eigen values

$$[\quad] * [v] = \lambda * v$$

↓
Eigen
value

$$A * v = \lambda * v$$

↑ v ↓

Eigen vector → Maximum magnitude

Eigen vector → Max Magnitude

Principal Component

Max Eigen vector

Max Var

Best Principal Component → PC1

Steps to calculate Eigen value and vectors

① Covariance of features

$$\begin{bmatrix} x & y \end{bmatrix}$$

Z

↓
x'

$$\text{Cov}(x, y) = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{N-1}$$

2x2

x y

$$A = \begin{matrix} x \\ y \end{matrix} \begin{bmatrix} \text{Var}(x) & \text{Cov}(x, y) \\ \text{Cov}(y, x) & \text{Var}(y) \end{bmatrix}$$

$$\text{Cov}(x, x) = \text{Var}(x)$$

$$\text{Cov}(y, y) = \text{Var}(y)$$

	x	y	Z
x			

y			
z			

$$\lambda_1, \lambda_2, \lambda_3$$

$$f_1 \text{ \& } f_2$$

$$A \cdot v = \lambda \cdot v$$

$$\begin{matrix} \lambda_1 & \lambda_2 \\ \downarrow & \downarrow \\ \text{PC1} & \text{PC2} \end{matrix}$$

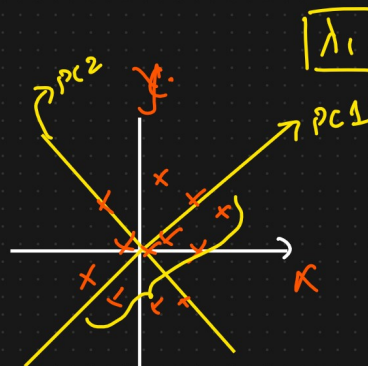

$$\lambda_1, \lambda_2 \rightarrow \text{Eigen values}$$

④

2D \rightarrow 1D

$|\lambda_1| \Rightarrow$ magnitude of the Eigen vector

① Standardize the data

② Covariance Matrix of x & y

$$A = \begin{matrix} & \begin{matrix} x & y \end{matrix} \\ \begin{matrix} x \\ y \end{matrix} & \begin{bmatrix} \text{Var}(x) & \text{Cov}(x,y) \\ \text{Cov}(y,x) & \text{Var}(y) \end{bmatrix} \end{matrix} \quad 2 \times 2$$

③ Find out Eigen vectors And value

$$A v = \lambda v$$

$$\lambda_1, \lambda_2 \Rightarrow \text{Eigen values.}$$

$$\begin{matrix} \downarrow & \downarrow \\ \text{PC1} & \text{PC2} \end{matrix}$$
